DuckOff

App Review Supporting Information for Guideline 4.3(a)

This document is provided to clarify the origin and history of DuckOff and to address the concern raised under Guideline 4.3(a).

Summary

DuckOff is a single standalone game product. It is not one of multiple similar apps submitted under different bundle IDs, developer accounts, or regional variants. It is not a repackaged third-party template.

Project History

DuckOff originates from my own earlier game development work. The original codebase for this game dates back to 2013, and the Android app had release history and updates through 2015 under my developer account.

The current iOS submission is a continuation and remake of that original game, rebuilt in Unity for modern devices and built for modern devices. It is based on our own prior product history, not on a purchased template or cloned submission.

I am able to provide supporting historical evidence from the original Android-era release, including:
- access to the original developer account
- screenshots from the earlier release
- source code from the earlier implementation
- repository/development materials connected to the project history

Original Product Characteristics

DuckOff contains its own gameplay structure and systems, including:
- duck-hunting arcade gameplay
- stage or campaign-based progression
- weapon systems and player progression
- score, lives, and combo mechanics
- achievements and daily objectives
- localized content and game presentation for its target audience

This app was created and submitted as one standalone game. It is not part of a group of near-identical submissions and is not intended to create duplicate App Store listings.

Clarification Regarding Guideline 4.3(a)

I understand Apple's concern regarding spam, duplicate apps, reskinned submissions, and template-based apps. I respectfully clarify the following:

- This app is derived from our own earlier game with an original codebase dating back to 2013 and Android release history through 2015.
- I did not purchase or republish a third-party app template for this submission.
- I am not submitting multiple reskinned variants of the same app.
- The current iOS version is a legitimate remake/continuation of our own historical product.

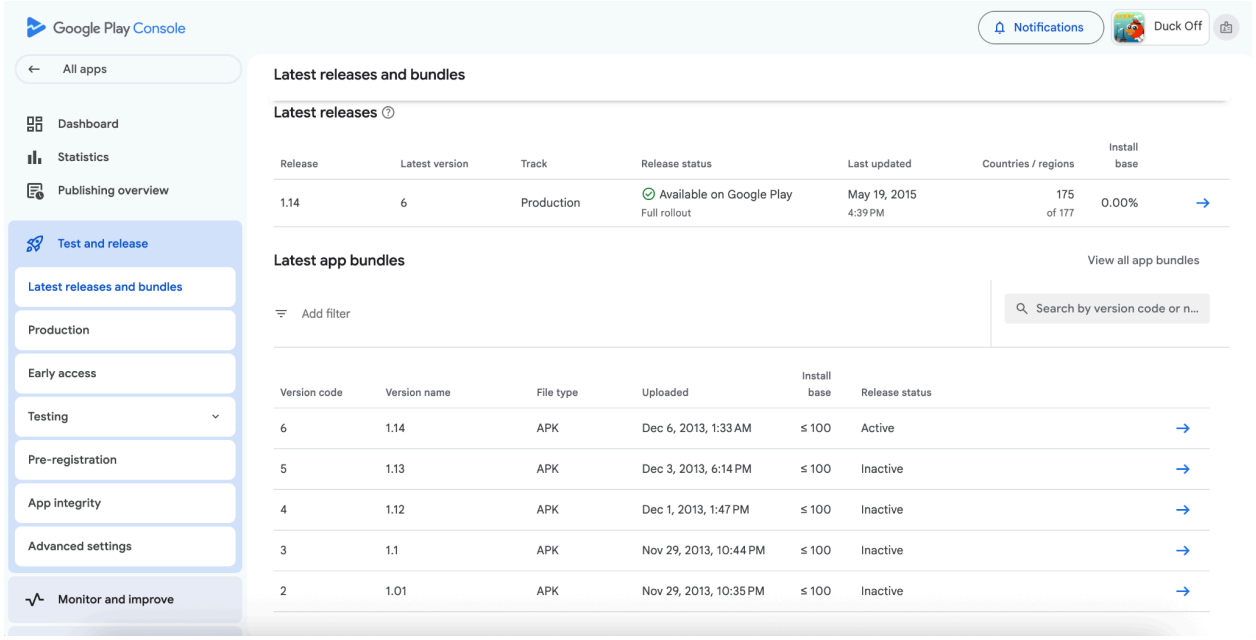
Supporting Evidence

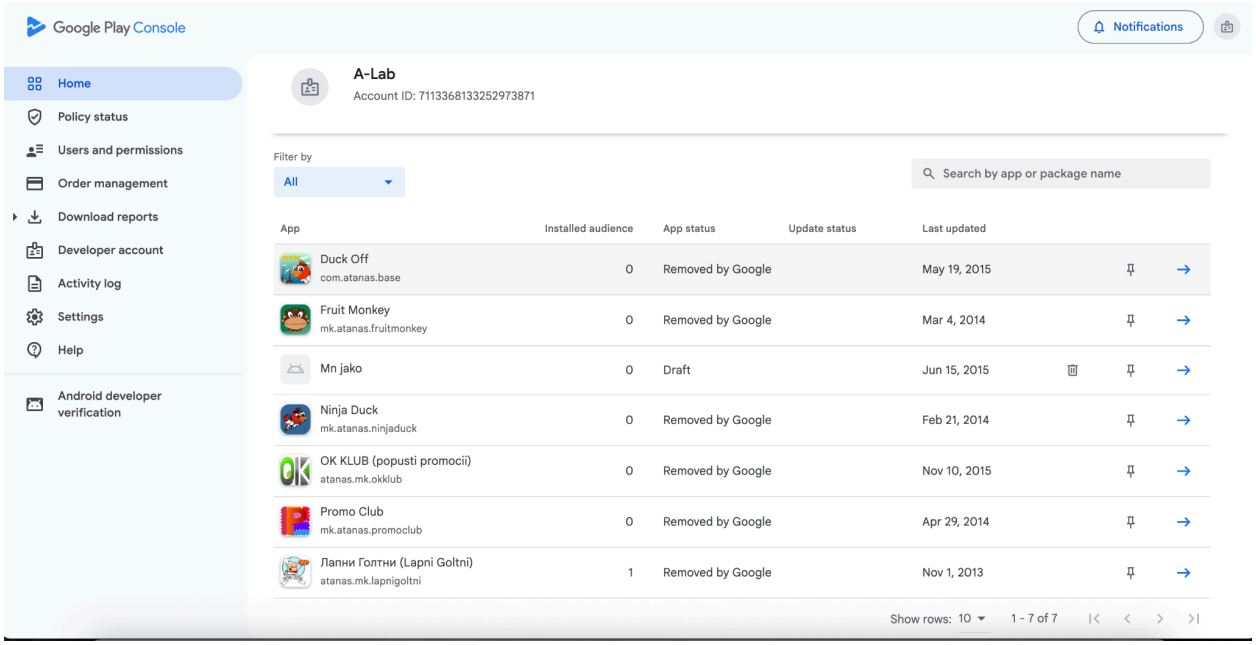
Attached or available upon request:

- screenshots from the original Android release
- evidence from the original developer account
- source code from the earlier version
- development/repository materials showing continuity between the earlier game and the current submission

I respectfully request reconsideration of the submission in light of this Information.

Following Screenshots from the Android store with the release dates from back in the days.





Screenshots from the old code base and important game logic files:
